

Options for Authors: The IFAR Article Portfolio

Original Research Manuscript

These reports typically include randomized trials, intervention studies, cohort studies, case-control studies, epidemiologic assessments, other observational studies, surveys with high response rates, cost-effectiveness analyses and decision analyses, translational research and studies of screening and diagnostic tests. Each manuscript should clearly state an objective or hypothesis. Research articles are generally 3500 words or fewer, exclusive of tables, figures, and references, and include the following section headings: Introduction, Materials and Methods, Results, Discussion, and Conclusion, which should conform to standard scientific reporting style. Systematic reviews with meta-analysis are included under this category.

Review Article

Review Articles of various types (e.g., Systematic Reviews without meta-analysis, Narrative Reviews, Evidence Based Reviews) address current topics of specialty importance. These are commonly written or led by a well-recognized leader in the field and can have a variety of lengths and numbers of Figures/Tables depending on content and topic. Authors should generally follow the author guidelines for Original Research Manuscripts for length and Table/Figures.

Research Note NEW!**

Research Notes (formerly Letters to the Editor) are peer-reviewed publications of clinical or laboratory observations, in abbreviated form. Research Notes are limited in scope relative to full length Research Manuscripts. Citation research shows that Research Notes are indexed in Medline, accessible to literature searches, and cited. A Research Note must be limited to 900 words and 2 tables or figures.

Correspondence and Reply

Correspondence concerning recent publications in IFAR or other subjects of unique interest to the readership will be considered for publication and accepted based on their pertinence, their scientific quality, and available space in the Journal. *Correspondence* can be used for case reports that are very unique or treatment techniques (e.g., How I do It) that are of great interest to the readership. When a particular Journal article is referenced in a *Correspondence*, *Reply* from the authors of the article will be requested. If approved through the editorial processes, the *Correspondence* and relevant *Reply* will both be published. Both *Correspondence and Reply* must contain no more than 750 words and begin with the salutation "To the Editor:"

Editorial

Editorials may address any important topic in medicine, public health, research, discovery, prevention, ethics, health policy, or health law and generally are not linked to a specific article. Editorials should be focused, scholarly, and clearly presented and should not include the findings of new research or data that have not been previously published. Editorials generally have one author but must have no more than 3 authors. Maximum length is up to 1000 words of text with one small table or figure, and no more than 10 references.

Please see the Author Guidelines at the IFAR website for full details on all of these options.
